

ABSTRACT OF THE DISCLOSURE

An electrical appliance includes a housing, an electric unit mounted within the housing, a winding unit mounted within the housing and including a reel member, an electrical wire connected electrically to the electric unit and wound around the reel member, and a latch unit engaging releasably the reel member to prevent the reel member from rotation in a winding direction of the reel member. The electrical wire has one end provided with a plug portion. The housing has at least one insert hole proximate to the latch unit for extension of the plug portion therethrough so as to press and disengage the latch unit from the reel member, thereby permitting the winding unit to wind the electrical wire.
